1.What is a functional interface in java, and where are they used?

JAVA

Functional interface is only containing one abstract method.

2.What Git commands have you used and what are they used for?

Git init : initialized empty local it repository in folder

Git commit -m: commit all file to folder

Git add . : add all files to initialized local repository

Git push : push the file to remote github/gitlab repository

Git pull : pull the file from remote github/gitlab repository

3.How can you connect to a database in core java, and how can you connect to a database in spring?

JAVA

4.what are the benefits of views in SQL?

Security: can give access to views instead of full table

Simplicity: can be simple way to view data

Consistency: ensures the view you access will always be the same without forgetting a long complex query

5. How do you create a many to many relationships between two tables?

By using junction table in the database. Junction table bridges the tables by referencing the primary keys of each table and contains the primary keys for both tables.
