3.what is the difference between joining and blending in tableau?

Joining: your data can only be done when the data comes from the same source, for example from two sheet tabs within a single Excel file.

Blending: is always required if the data is stored in two separate data sources within Tableau

4. what are constraints in SQL?

Define rules for store data in columns.

Primary key: set the primary key

Foreign key: set the foreign key

Default: no value given set default value

Check: does Boolean check on values to see if meet the condition or not

Unique: all data must be unique o the column

Not null: can not be null on the column

5.what are UNION, MINUS and INTERSECT commands?

UNION: returns all rows from both query

INTERSECT: returns on common records from both queries

MINUS: returns records from left query that are not exist on the right query.
